Breast Cytohistology

Comprehensive coverage of surgical pathology and cytopathology of breast lesions, with example vignettes and over 200 photomicrographs.

Breast Cytohistology

Breast cancer remains the leading cause of cancer in women, which makes accurate diagnoses on core needle biopsy (CNB) specimens of vital importance in staging and guiding therapy decisions for patients. The first edition of this multi-authored text written by leaders in the field from major academic medical centers provided a comprehensive guide on diagnostic breast pathology in the core biopsy setting. In addition to in-depth coverage of benign and malignant entities encountered in breast core biopsies, the book provided additional resources to improve diagnostic accuracy such as pattern-based approaches to evaluation, mimickers of breast lesions arising in extra-mammary sites, and pitfalls specific to small tissue samples. In recent years, there have been several notable developments in the field of breast pathology including revisions in AJCC breast cancer staging, updated guidelines in the testing and reporting of ER, PR, and HER2, as well as implementation of immunotherapy and companion biomarker testing. In addition, several key updates were included in the most recent edition of the WHO Classification of Breast Tumours (2020). In addition to updates specific to individual breast entities, the second edition will detail updates regarding biomarker testing in the primary and metastatic setting, and incorporate newly defined entities and updated definitions of rare tumors in alignment with the WHO Classification of Breast Tumours (2020). Furthermore, this edition will address the role of CNB in companion biomarker testing for eligibility for immunotherapy in the context of advanced triple-negative breast carcinoma. Written by leaders in the field and edited by expert breast pathologists, The Second Edition of Comprehensive Guide to Core Needle Biopsies of the Breast is the definitive reference on breast core needle biopsies for practicing pathologists, pathology trainees, oncologists and clinicians of patients with breast disease.

This text describes a system of reporting breast fine needle aspiration biopsy that uses five clearly defined categories, each described by a specific term and each with a specific risk of malignancy. The five categories are insufficient/inadequate, benign, atypical, suspicious of malignancy and malignant. Each category has a risk of malignancy and is linked to management recommendations, which include several options because it is recognized that diagnostic infrastructure, such as the availability of core needle biopsy and ultrasound guidance, vary between developed and low and middle income countries. This text includes key diagnostic cytological criteria for each of the many lesions and tumors found in the breast. The cytopathology of specific lesions is illustrated with high quality photomicrographs with clear figure descriptions. Chapters also discuss current and potential future ancillary tests, liquid based cytology, nipple cytology and management. An additional chapter provides an overview of an approach to the diagnosis of direct smears of breast fine needle aspiration biopsies. The International Academy of Cytology Yokohama System for Reporting Breast Fine Needle Aspiration Biopsy Cytopathology provides a clear logical approach to the diagnosis and categorization of breast lesions by FNAB cytology, and aims to facilitate communication with breast clinicians, further research into breast cytopathology and related molecular pathology, and improve patient care.

The heart is invested with a complex, intertwining network of blood and lymphatic vessels which, respectively, provide the cardiac tissue with oxygen and nutrients and eliminate excess fluid from the interstitium. The coronary blood vessels have been the focus of much investigation in the past few decades. On the other hand, the literature regarding the cardiac lymphatic vessels remains sparse, despite their important role in maintaining normal heart function. With this in mind, a better understanding of the cardiac lymphatic network and its ability to regulate fluid homeostasis within the heart could give us insight into developing therapies for the alleviation of several cardiac pathological conditions.

'A unique and innovative approach to family issues in psychiatric disorders. The authors tackle a broad range of complex issues that are rarely covered in the depth or with the expertise that this volume brings. This book is a major contribution to the field and provides the kind of international perspective that enhances our understanding of the complex dimensions of psychiatric disorders from a multigenerational and cross-cultural perspective.' From a review of the first edition by Carol Nadelson, Professor of Psychiatry, Harvard Medical School. It is indisputable that mental illness in a parent has serious and often adverse effects on the child, something which is surprisingly unreflected in clinical service provision. In this completely rewritten second edition, an international, multidisciplinary team of professionals review the most up-to-date treatment interventions from a practical, clinical point of view. It is essential reading for all professionals dealing with adult mental illness and child-care.

Alphaherpesviruses are a fascinating group of DNA viruses that includes important human pathogens such as herpes simplex virus type 1 (HSV-1), HSV-2, and varicella-zoster virus (VZV): the causative agents of cold sores, genital ulcerous disease, and chickenpox/shingles, respectively. A key attribute of these viruses is their ability to establish lifelong latent infection in the peripheral nervous system of the host. Such persistence requires subversion of the host's immune system and intrinsic antiviral defense mechanisms. Understanding the mechanisms of the immune evasion and what triggers viral reactivation is a major challenge for today's researchers. This has prompted enormous research efforts into understanding the molecular and cellular biology of these viruses. This up-to-date and comprehensive volume aims to distill the most important research in this area providing a timely overview of the field. Topics covered include: transcriptional regulation, DNA replication, translational control, virus entry and capsid assembly, the role of microRNAs in infection and oncolytic vectors for cancer therapy. In addition there is coverage of virus-host interactions, including apoptosis, subversion of host protein quality control and DNA damage response pathways, autophagy, establishment and reactivation from latency, interferon responses, immunity and vaccine development. Essential reading for everyone working with alphaherpesviruses and of interest to all virologists working on latent infections.

This book provides a detailed update on all aspects of fine-needle aspiration cytology of breast lesions. It will serve readers as an up-to-date reference and atlas on both new entities in breast pathology, including borderline lesions such as flat epithelial atypia, and the classic benign and malignant lesions. Throughout, emphasis is placed on the characteristic diagnostic features as well as the common pitfalls faced by cytologists. As cytologic features can be highly variable, corresponding cytology and histology images are displayed together, enabling readers to gain a good understanding of the morphologic features of various lesions. Core-needle biopsy and fine-needle aspiration cytology are compared in depth, with attention to their relative strengths and weaknesses and indications. In addition, the impact of molecular classification of breast cancers on cytologic diagnosis is explored, and the use of molecular techniques in diagnostic cytology is discussed.

Chronic inflammation predisposes to some forms of cancer and the host response to malignant disease shows several parallels with inflammation and wound healing. The cells involved in inflammation are detected in a range of common cancers, together with the inflammatory cytokines and members of the chemokine ligand/receptor systems. Neutralization or deletion of the gene for some inflammatory cytokines confers resistance to tumour induction and experimental metastasis. Over-expression of such cytokines in tumour cells may enhance malignant potential. Certain chemokines are likely to subvert antitumour immunity by favouring development of ineffective Type 2 responses. Tumour cells may even utilize chemokine receptors in homing to lymph nodes and other organs. Thus, the cells, cytokines and chemokines found in tumours are more likely to contribute to tumour growth, progression and immunosuppression than they are to mount an effective host antitumour response. This book draws together contributions from an international group of scientists and clinicians from diverse disciplines, ranging from epidemiology to immunology, cell biology, molecular oncology, molecular medicine and pharmacology to debate these and related issues. Topics covered include the epidemiological links between cancer and inflammation, the parallels between inflammation and cancer, the role of inflammation in cancer, inflammatory genes as risk factors for cancer initiation and progression, inflammation and cancer angiogenesis, and preventative and therapeutic strategies.
